

Nicholas Kimball

INTEGRATION ENGINEER | SYSTEM INTEGRATION, APIS & AI

nickkimball12@gmail.com · Madison, WI · Remote / Open to relocation

SUMMARY

Integration engineer who owns integrations end to end, from discovery and requirements through build, testing, go-live, and production support. I design and build integrations against REST/SOAP APIs, map and transform data between systems that speak different formats, and troubleshoot production issues to root cause. I work directly with customers as a technical advisor, translate business needs into technical solutions, and turn one-off work into reusable patterns. I also build and deploy AI systems on the Anthropic (Claude) API and use AI daily in my engineering work.

SKILLS

Integration: End-to-end integration ownership, REST/SOAP APIs (authentication, pagination, retries, error handling, idempotency), data mapping / transformation / normalization, JSON, XML, CSV, webhooks, scheduled polling, event-driven workflows, monitoring

Engineering: Backend development, distributed and multi-threaded systems, relational databases and data modeling, SQL, root-cause debugging, reliability and fault tolerance

AI: Built and deployed agentic AI systems on the Anthropic (Claude) API (tool-calling, evaluation layers); prompt engineering; working knowledge of Model Context Protocol (MCP); daily use of AI in development

Customer & Delivery: Technical discovery, requirements gathering, translating business needs into technical designs, customer-facing advising, statements of work, technical documentation, reusable patterns

Languages & Platforms: Python, Java, C#, JavaScript, SQL, Bash, Git, AWS

PROFESSIONAL EXPERIENCE

Software Integration Engineer, ProShip · Apr 2024 to Present

Enterprise shipping & logistics software · Remote

- Own integrations end to end across 75+ customer environments: discovery and requirements, build, testing, cutover/go-live, and support. Delivered 4 major integrations spanning 3 months to a year each.
- Design and build integrations against REST/SOAP APIs, mapping and transforming data between systems in a range of formats (JSON, XML, CSV, SQL, APIs) into a canonical format and back out, driven by mapping specifications I author.
- Resolve 92% of production issues without escalation by troubleshooting to root cause through source code and audit data and delivering durable, well-documented fixes.
- Rated and hardened an architecture handling ~1M API requests/day at peak, multi-server and multi-threaded, delivering sub-2-second responses across up to 6 external carrier APIs.
- Act as the technical advisor on customer engagements, translating business needs into technical requirements and communicating through go-live; the flagship integration drove 45% repeat business across 20+ engagements.
- Modernized and standardized integrations, migrating 5 legacy integrations to a modern framework and turning one-off work into reusable patterns.

Software Quality Engineer, Cognizant Technology Solutions · Jan 2021 to Apr 2023

Remote

- Built automated regression and validation coverage for real-time data-ingestion pipelines, saving 50+ hours of manual testing biweekly and enforcing data integrity across systems.
- Delivered 15+ releases with zero critical production issues by building coverage for edge cases and improving CI feedback loops.

SELECTED PROJECT — DEPLOYED AGENTIC AI SYSTEM (ANTHROPIC / CLAUDE API)

- Designed and deployed an autonomous agentic system on the Claude API (Python, tool-calling, human-in-the-loop approval), integrating multiple external APIs with OAuth and secure secrets handling, running unattended in the cloud (AWS).
- Built an evaluation layer with LLM-as-judge scoring and a deterministic validator, benchmarking models on quality against token cost and latency, direct experience building AI that is reliable and measurable.

EDUCATION

B.S. Computer Science, University of Wisconsin-Madison · Dec 2019
